steps you adopt. Step 1 All you need to get running with DCC is a Control System (DCC Command station) and a loco fitted with a DCC decoder.

## A General Guide to DCC

RED WIRE – this is to pick up power from the track.

Traditionally, this should be connected to the pickups that collect power from the RIGHT rail (That is, right from the loco driver point of view). BLACK WIRE – this is also to pick up power from the track. Traditionally this should be connected

However, as with any electric railway, there is wiring to be

done, but because DCC controls the locomotives individually, there is no need to split the track into many sections in order to run multiple locos, making DCC layouts easier to wire than DC. The principle of wiring a DCC layout is simple- supply power to all areas of the layout, avoiding the possibility of any short circuits.

## Model Railway Digital Command Control (DCC) - Wiring a layout

A DCC ready locomotive is one that has the wiring from the wheel pickups, motor and the lights terminating at a socket, in the case of HO — 8 pin, N — 6 pin and O — 2 times 4 pin sockets. The loco will run on DC due to a jumper plug being inserted from

Here are some recommendations for wiring turnouts on a DCC layout... Feed track power to all routes in and out of the turnout. Feed track power to all metal rails in the turnout. Use live frog turnouts if possible. Feed track power to live frog using frog polarity switcher. Use "DCC-ready" or "DCC-friendly turnouts" if possible.
